

Here you will find instructions how to use shipped application. Please follow steps below:

- extract files into desired location

- run "npm i" which would generate "node_modules" folder and install required library dependencies;

- Webpack is used as bundler/build tool for this project. Although necessary files are already prepared, you can run minification/uglifyfication process at any time. Two scripts are at your disposal:

- "npm run dev" will start webpack files watcher;
 - "npm run build" will minify/uglify necessary files after changes;

- run "node server" from extracted location, which would fire up simple local node server on "http://localhost:9000/"
